

Oracle Database 10g
The Self-Managing Database

Benoit Dageville
Oracle Corporation
benoit.dageville@oracle.com

ORACLE

Agenda

- Oracle10g: Oracle's first generation of self-managing database
- Oracle's Approach to Self-managing
- Oracle10g Manageability Foundation
- Automatic Database Diagnostic Monitor (ADDM)
- Self-managing Components
- Conclusion and Future Directions

ORACLE

Oracle10g

ORACLE

Oracle10g

- Oracle10g is the latest version of the Oracle DBMS, released early 2004
- One of the main focus of that release was self-management
 - Effort initiated in Oracle9i
- Our vision when we started this venture four years ago: **make Oracle fully self-manageable**
- We believe Oracle10g is a giant step toward this goal

ORACLE

Oracle's Approach

ORACLE

Oracle's Approach: Server Resident

- Technology built inside the database server
 - Eliminate management problems rather than "hiding" them behind a tool
 - Minimize Performance Impact
 - Act "Just in Time" (e.g. push versus pull)
 - Leverage existing technology
 - Effective solutions require complete integration with various server components
 - server becoming so sophisticated that a tool based solution can no longer be truly effective
 - Mandatory if the end-goal is to build a truly **self-managing** database server

ORACLE

Oracle's Approach: Seamless GUI Integration

ORACLE

Oracle's Approach: Holistic

- Avoid a collection of point solutions
- Instead, build a comprehensive solution
 - Core manageability infrastructure
 - Comprehensive statistics component
 - Workload Repository
 - Server based alerts
 - Advisory framework
 - Central self-diagnostic engine built into core database (Automatic Database Diagnostic Monitor or ADDM)
 - Self-managing Components
 - Auto Memory Management, Automatic SQL Tuning, Automatic Storage Management, Access Advisor, Auto Undo Retention, Space Alerts, Flashback....
- Follow the self-managing loop: **Observe, Diagnose, Resolve**

ORACLE

Oracle's Approach: **Out-of-box**

- Manageability features are enabled by default
 - Features must be very robust
 - Minimal performance impact
 - Outperform manual solution
 - Self-managing solution has to be self-manageable!
 - Zero administrative burden on DBAs
- Examples
 - Statistics for manageability enabled by default
 - Automatic performance analysis every hour
 - Auto Memory Management of SQL memory is default
 - Optimizer statistics refreshed automatically
 - Predefined set of server alerts (e.g. space, ...)
 - And much more.....

ORACLE

Oracle's Approach: **Manageability for All**

- Low End Customers
 - No dedicated administrative staff
 - Automated day to day operations
 - Optimal performance out of the box, no need to set configuration parameters
- High End Customers
 - Flexibility to adapt product to their needs
 - Self-management features should outperform manual tuning and ensure predictable behavior
 - Need to understand and monitor functioning of self-management operations
 - Help DBAs in making administrative decisions (no need for DBA to be rocket scientist!)
- Any workload: OLTP, DSS, mixed

ORACLE

Oracle's Approach: **Manageability Architecture**

ORACLE

Statistics: Classes

- Database Time Model
 - Understand where database time is spent
- Sampled Database Activity
 - Root cause analysis
- What-if
 - Self managing resource (e.g. memory)
- Metrics and Metric History
 - Trend analysis, Capacity planning
 - Server alerts (threshold based), Monitoring (EM)
- Base Statistics
 - Resource (IO, Memory, CPU), OS, SQL, Database Objects, ...

ORACLE

Statistics: Database Time Model

ORACLE

Statistics: Sampled Database Activity

- In-memory log of key attributes of database sessions activity
- Use high-frequency time-based sampling (1s)
- Done internally, direct access to kernel structures
- Data captured includes:
 - Session ID (SID)
 - SQL (SQL ID)
 - Transaction ID
 - Program, Module, Action
 - Wait Information (if any)
 - Operation Type (IO, database lock, ...)
 - Target (e.g. Object, File, Block)
 - Time

➔ Fine Grained History of Database Activity

ORACLE

Statistics: Sampled Database Activity

ORACLE

Statistics: What-if (Overview)

- Predict performance impact of changes in amount of memory allotted to a component, both decrease and increase.
- Highly accurate, maintained automatically by each memory component based on workload.
- Use to diagnose under memory configuration (ADDM).
- Use to decide when to transfer memory between shared-memory pools (Auto Memory Management).
- Not limited to memory (e.g. use to compute auto value of MTTR)
- Produced by
 - Buffer cache
 - Shared pool - integrated cache for both database object metadata and SQL statements
 - Java cache for class metadata
 - SQL memory management - private memory use for sort, hash-joins, bitmap operators

ORACLE

Statistics: What-if (Example)

- Reducing buffer cache size to 10MB increases IOs by a 2.5 factor
- Increase buffer cache size to 50MB will reduce IOs by 20%

ORACLE

Base Statistics – e.g. SQL

- Maintained by the Oracle cursor cache
- SQL id – unique text signature
- Time model break-down
- Sampled bind values
- Query Execution Plan
- Fine-grain Execution Statistics (iterator level)
- Efficient top SQL identification using Δs

ORACLE

AWR: Automatic Workload Repository

- Self-Managing Repository of Database Workload Statistics
 - Periodic snapshots of in-memory statistics stored in database
 - Coordinated data collection across cluster nodes
 - Automatically purge old data using time-based partitioned tables
 - Out-Of-The-Box: 7 days of data, 1-hour snapshots
- Content and Services
 - Time model, Sampled DB Activity, Top SQL, Top objects, ...
 - SQL Tuning Sets to manage SQL Workloads
- Consumers
 - ADDM, Database Advisors (SQL Tuning, Space, ...), ...
 - Historical performance analysis

ORACLE

Automatic Database Diagnostic Monitor (ADDM)

ORACLE

ADDM: Motivation

Problem: Performance tuning requires high-expertise and is most time consuming task

- Performance and Workload Data Capture
 - System Statistics, Wait Information, SQL Statistics, etc.
- Analysis
 - What types of operations database is spending most time on?
 - Which resources is the database bottlenecked on?
 - What is causing these bottlenecks?
 - What can be done to resolve the problem?
- Problem Resolution
 - If multiple problems identified, which is most critical?
 - How much performance gain I expect if I implement this solution?

ORACLE

ADDM: Overview

- **Diagnose** component of the system wide self-managing loop
- ... and the entry point of the **resolve** phase
- Central Management Engine
 - Integrate all components together
 - Holistic time based analysis
 - Throughput centric top-down approach
 - Distinguish symptoms from causes (i.e root cause analysis)
- Runs proactively out of the box (once every hour)
 - Result of each analysis is kept in the workload repository
- Can be used reactively when required

➔ ADDM is the system-wide optimizer of the database

ORACLE

How Does ADDM Work?

- Top Down Analysis Using AWR Snapshots
- Classification Tree - based on decades of Oracle tuning expertise
- Identifies main performance bottlenecks using time based analysis
- Pinpoints root cause
- Recommend solutions or next step
- Reports non-problem areas
 - E.g. I/O is not a problem

ORACLE

ADDM: Methodology

Problem classification system

- Decision tree based on the Wait Model and Time Model

ADDM: Taxonomy of Findings

- Hardware Resource Issues
 - CPU (capacity, top-sql, ...)
 - IOs (capacity, top-sql, top-objects, undersized memory cache)
 - Cluster Interconnect
 - Memory (OS paging)
- Software Resource Issues
 - Application locks
 - Internal contention (e.g. access to db buffers)
 - Database Configuration
- Application Issues
 - Connection management
 - Cursor management (parsing, fetching, ...)

ORACLE

ADDM: Real-world Example

- Reported by Qualcomm when upgrading to Oracle10g
- After upgrading, Qualcomm noticed severe performance degradation
- Looked at last ADDM report
- ADDM was reporting high-cpu consumption
 - and identified the root cause: a SQL statement
- ADDM recommendation was to tune this statement using Automatic SQL tuning
- Automatic SQL tuning identified missing index. The index was created and performance issue was solved
- In this particular case, index was dropped by accident during the upgrade process!

ORACLE

Automatic Memory Management

- Shared Memory Management
 - Automatically size various shared memory pools (e.g. buffer pool, shared pool, java pool)
 - Use "what-if" statistics maintain by each component to trade off memory
 - ➔ Memory is transferred where most needed
- Private Memory (VLDB 2002)
 - Determine how much memory each running SQL operator should get such that system throughput is maximized
 - Global memory broker: compute ideal value based on memory requirement published by active operators
 - Adaptive SQL Operators: can dynamically adapt their memory consumption in response to broker instructions
- No need to configure any parameter except for the overall memory size (remove many parameters)

ORACLE

Automatic SQL Tuning: SQL Profiling

- Persistent: works across shutdowns and upgrades
- SQL profiling ideal for packaged applications (no change to SQL text)

ORACLE

SQL Profiling: Performance Evaluation

Using 73 high-load queries from GFK, a market analysis company located in Germany

Before...

...After

ORACLE

Automatic SQL Tuning: What-if Analysis

- Schema changes: invokes access advisor
 - Comprehensive index solutions (b-tree, bitmap, functional)
 - Materialized views recommendations maximizing query rewrite while minimizing maintenance cost
 - Any combination of the above two (e.g. new MV with an index on it)
 - Consider the entire SQL workload
- SQL Structure Analysis
 - Help apps developers to identify badly written statements
 - Suggest restructuring for efficiency by analyzing execution plan
 - Solution requires changes in SQL semantic → different from optimizer automatic rewrite and transformation
 - Problem category
 - Semantic changes of SQL operators (NOT IN versus NOT EXISTS)
 - Syntactic change to predicates on index column (e.g. remove type mismatch to enable index usage)
 - SQL design (add missing join predicates)

ORACLE

Conclusion & Future Directions

- Oracle10g major milestone in the Oracle's manageability quest
 - Manageability foundation
 - Holistic Management Control (ADDM)
 - Self-manageable components
- Future
 - Oracle11g: find an EVE for ADDM?
 - Even more self-manageable by fully automating the resolve phase
